

Help us understand:

How Non-Alcoholic Fatty Liver disease Progresses?

Investigating Early Biomarkers through MRI and Stable Isotopes!

- You could take part if you have been diagnosed with NAFLD, simple steatosis, NASH or Cirrhosis, that is not due to alcohol.
- You will need to participate on two separate days
 - Day 1: 2 MRI scans each lasting approximately 60 minutes
 - Day 2: You will drink heavy water and have a meal containing a stable isotope, while blood samples and breath samples will be obtained over 8h.
- Participants will receive a reimbursement for their time.
